

# THE DANGERS OF BRING-YOUR-OWN-DEVICE (BYOD)

**BYOD** remains both as an opportunity and challenge for enterprises – especially if it's not implemented correctly.

Without proper security policies in place, having a BYOD scheme may cause worries for:

1

*Data breach* is always one-click away and you can't do anything about it since personal devices, if regulated, feels like an invasion of privacy.

2

If you use specific software for projects, a **personal device might not be suitable** to run the program - causing problems in installation and disrupting work.

3

If you allow unregistered devices to your network, **you don't know if it has the right data security** in place or if it has weak spots which hackers can benefit from.

4

BYOD more often than not, **can affect an employee's productivity**. Since it's their own device, they can use it for personal reasons even during office hours.

## RECENT BYOD STATISTICS

**50%**

of companies were breached through employee-owned devices

**21%**

use social media during office hours

**15%**

of employees have accessed sensitive company data from their own devices
